

Your PRT-6301 Router

Wireless Connectivity Tips

Improving Wi-Fi connectivity:

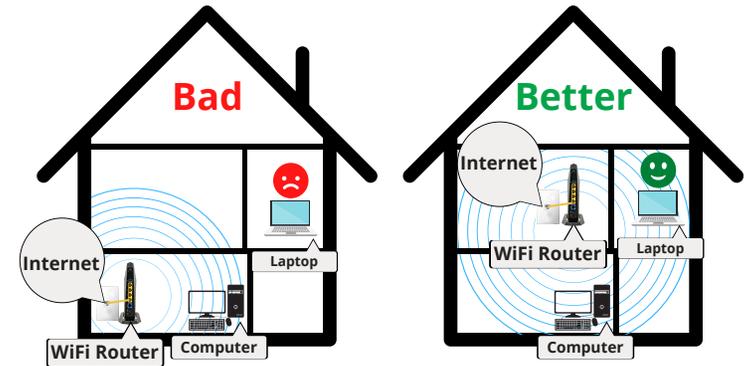

The wireless router should ideally be placed in a centralized location in your home free of obstructions to provide the best coverage and connectivity. The router should not be placed in a closet, or level that is different than the living area such as a basement, or on one end of the home.

Which Wi-Fi signal should I connect to, 2.4 Ghz or 5 Ghz?

If faster speeds are most important to you, 5Ghz is usually a better choice than 2.4Ghz.

If the wireless range is more important to you, 2.4 Ghz is usually a better choice than 5Ghz.

If you have a lot of devices that use 2.4 Ghz and you are experiencing interference or intermittent connectivity issues, then switching to the 5 Ghz is probably a better option.

2.4GHz

- Web Browsing
- Social Connecting: Posting/Tweeting/ Sharing
- Emailing

5GHz

- Ultra Fast Video Sharing
- Online Gaming
- High Volume Sharing

DUAL-BAND ROUTER
